Two days Non Residential Training on CRP & Progressive Farmer

Special Programme for Promotion of Millet in Tribal Areas of Odisha (Malkangiri District)
Organised by: - Gapabandhu Development Society. Facilitated by:- WASSAN

Venue: GDS Conference Hall Malkangiri

Date: 17th & 18th October.2022.

Day- I

Two days Non Residential Training on CRP & Progressive Farmer was organized by Gapabandhu Development Society at GDS Conference Hall Malkangiri on 17th & 18th October.2022. The project staff including 05 nos CRP, BAO and VAW (RP) along with 11 Progressive Seed Farmer actively participated.

Then Programme Coordinator of Millet Mission gave his inaugural speech he recapitalizes their previous experience SMI. How it was started in 4 Gps of 40 villages of 185 Hact. with the 273 no of farmer. The experience and how the project member took challenges to promote Millet programme in rural and remote tribal areas, where communication emerge as bigger threat and lake of nutrient awareness among the community dwellers.

Finger Millet is one of the most nutritious of all the major cereal crops and a part of the daily diet of the rural population of the Malkangiri district. It is one of the widely cultivated food crops of Malkangiri District. Finger Millet

known as a rain fed crop, suitable for dry land, adaptable to climate stress, require less nutrient care and management, less disease attacks in spite of all these advantages the production of this crop is neglected throughout the state of Odisha. So that WASSAN introduced "Special Programme for Promotion of milliets in tribal areas" a program of Department of Agriculture, Odisha Government. Finger Millet (Ragi) is an important millet crop in the Malkangiri block of Malkangiri District both in the tribal food of cultures and in the farming systems. The average productivity is around 1.5 to 2 Qtl. per acres yield. After intervention of Gapabandhu Development Society through the project by adopting Morden technology it has increased in SMI 7 to 8 Qtl & LT 6 to 7 Qtl per acre yield.

The registration for training was started at 10 am by CRP Narayan Khara A total number of 11 Progressive Farmers and 05 CRP were registered

Then the programme was carried forward to Mr.Abhilash Mahanty (VAW) and Mr. Krishnapada Mukherjee (BAO) Resource Person. During his lecture and using drawing sheet he tray to educate flowing method to the participants.

Classes of Quality seed

Nucleus Seed: Nucleus seed has 100% genetic & physical purity

Nucleus seed is multiplied and maintained by selecting individual panicles and growing individual panicle progenies row

Breeder Seed: Breeder seed tag is golden yellow in colour and the bags should be tagged properly showing the minimum prescribed quality standards

Breeder seed is the source for initial and recurring increase of Foundation Seed

Foundation Seed: Foundation seed tag is white in colour and carries all the relevant information about the foundation seed lot contained in the bag.

The genetic purity of foundation seed should be maintained at 99.5 per cent.

The production of foundation seed shall be supervised and approved by the Certifying Agency and be so handled as to maintain specific genetic identity and genetic purity and shall be required to confirm certification standards. It is white in Colour

Certified Seed: Certified seed is the progeny of foundation seed.

Certified seed can also be the progeny of certified seed provided this reproduction does not exceed three generations beyond foundation seed stage I. Certified seed produced from foundation seed is called certified seed stage I, while Certified seed produced from certified seed is called certified seed stage II. Certified seed stage II cannot be used for further seed multiplication. Certified seed tag is blue in colour and carries all the relevant information about the certified seed lot contained in the bag.

Then it will go to Farmers Field

Traditional varieties: Traditional varieties are ecotypes cultivated for a long time in pristine habitats.

- Farmers have been exercising silent selection for traits preferred for their cooking habits and consumption culture.
- Selected landraces highly adapted to their native growing areas, conditions and the culture of tribal's who practice a traditional agronomy as was explained to them by their ancestors.

Mr. Abhilash Mahanty (VAW) presented about Seed Standard and its uses from beginning to end. The stakeholders get involved in implementing in their field through the programme.

Separation of quality seeds

- Soaked in Water to remove chaffs, inert materials and some unviable seeds
- Soaked in Salt water to remove completely unviable seeds, then wash the seeds 2-3 times in normal water to remove salt deposits
- Seed treatment by using JIBAMRUTA

Nursery prepare raise bed (10 x 1.5 x 0.15) meter. Leave 30cm water channel between the 4 beds in 10 cent area of land for cultivation of one Acre of land.

Preparation of Main field for line transplanting farmer should keep the row 10meter (by a rope) and maintain the following distance. For SRI planting use the marker (10 inch x 10 inch)

Nutrient management:

Basal: 50ql/acre FYM or 5ql vermicompost with 50kg Neem cake

1st weeding: apply 20 lit of *Jibamruta*

2nd weeding: apply 20 lit of *Panchagavaya*

Weeding:

1st weeding – 15 days after transplanting soon after the weeding immediate apply JIBAMRUTA/HANDI KHATA for pest and disease control.

2nd weeding – 30 days after transplanting soon after the weeding immediate apply JIBAMRUTA/HANDI KHATA for pest and disease control.

3rd weeding – 45 days after transplanting soon after the weeding immediate apply JIBAMRUTA/HANDI KHATA for pest and disease control.

Day – 2

Begins with day one recap by program coordinator then the programme was carried forward to Mr. Krishnapada Mukherjee (BAO) Resource Person

Water Management Irrigation: The irrigation should be done once a week after life irrigation on the third day of sowing. Irrigation during flowering and grain setting stages are very critical.

Pest and disease management: Ragi is affected by pests and diseases like pink stem borer, aphids, root aphids, earhead caterpillars, blast, brown spot, mottle streak virus etc., at different growth stages.

Rouging: Rouging important to be done often to remove the off-types, volunteer plants and diseased plants from the seed production field to avoid the genetic contamination. A minimum of two inspections should be done between flowering and maturity stages by the Seed Certification Officer. The first inspection is done at the time of flowering to check the isolation and off-types and the second done during the maturity stage prior to harvest to check the off-types and to estimate the yield.

Harvesting and processing:

Harvest is done once the earheads are physiologically mature.

Harvesting is done in two pickings since, the maturation of the earheads are not uniform because of the tillering habit of the crop.

Second harvesting should be done seven days after the first one.

Threshed grains are further cleaned by winnowing.

18 Oct 2022 2:41:13 pm
 Unnamed Road
 Malkangiri
 Odisha

Drying and storage:

The cleaned seeds should be sun dried to attain a safe moisture level of 12%. Care should be taken while drying to avoid mechanical injury to the seeds and contamination. Seeds can be stored up to 13 months under proper storage conditions

Seed standards: The percentage of minimum physical purity of certified and foundation seeds should be 97% with a minimum of 75% of germination capacity and 12% of moisture content. The presence of inert matter should not exceed 2.0%.

18 Oct 2022 2:41:32 pm
Unnamed Road
Malkangiri
Odisha

If the farmer followed above mention technique then farmer would be get as much as better yield and quality seed to sell among the village farmers which is create sustainable livelihood. By the end of the training program all the participant promised to follow the technique during their cultivation of Ragi

The two days programme was closed by giving vote of thanks to all.
